

This blog focuses on rigging, and I would like to share my own research and thoughts on it.

I primarily use Maya for rigging. In my understanding, the general workflow involves creating IK FK and result joints. Then linking the joint in the node editor using techniques like blend colour and blend matrix, while paying attention to issues such as whether the joint orient is zero. Sometimes constraints can also be helpful. Next is painting the weight. In this process, I also need to create the controller and bind them with joints.

During the group project in level 6. My role is rigger and I am responding to create the rig file for the given model. Although the process seemed simple and workable, I feel confidence for this job.

antCGI. (2026). *antCGI*. [Online]. YouTube. Available in <https://youtube.com/@antcgi?si=WuEiDfM8PIMDPSoj>[Assessed in 24 Feb 2026]

I have followed AntCGI on YouTube to do the rig. Strangely, I followed the tutorial step by step, the model in the tutorial was fine, but the process is not going smoothly for me. I spent a lot of time and still could not solve these problems, at least I learned about the professional rigging process. After creating the most basic joint, I need to improve the rotation axis and orientations. Then I will start painting skin weights. Next comes the "accident hotspot"—creating controllers and starting the hierarchy in the node editor. Sometimes the connection between rotate node of joint and parent Matrix will cause the model stuck at the position. Ignoring those, I will start IK and FK creation. I may create some attributes like squashing and stretching in the attribute editor.

I realised the limitations of manual rigging, especially when I wanted to ask for help from others, they would say, "Oh, we all use adv rigging now. Probably not many people will spend time figuring out the problems my rigging is causing." So, I started researching how to use the Advanced Skeleton plugin. To be honest, it is more efficient and saves time. It has less problems than the former. It took me about a month to rig it, while adv took a week. It gave me fine-tuning control; I only needed to do some changes to weights and add a few controllers I liked to complete the whole project.

After rigging work. I have done some reflection, I believe that in future work, I can first create a rig file using Advanced Skeleton, which will ensure that basic interactions with no problems. Then I can make some adjustments and changes. I do not think rigging alone will be enough for me to get a job. So, I want to combine animation and rigging, since I chose animation and rigging as my major courses in university. Because the deadline of the group project is approaching. I did not have much tie to study advanced skeleton in detail. I am writing this blog in early May. I will plan to study the usage and

functions of adv in detail after my Level 6 study, so that I can get started with rigging more quickly in future mayor projects or jobs.

Overall, I am looking forward I can successfully have a job😊
