

I was choosing between 2D animation and 3D animation two years ago. I am actually better in 2D. However, after a long-time consideration, I chose 3D Animation Visual Effects at Bournemouth University finally. Firstly, I believe 3D animation offers wider range of job prospects, although the production difficulty might be higher than 2D, this skill is likely to be more welcomed after. Secondly, 3D has stronger expressive capabilities in certain areas than 2D, and offers more options, such as visual effects/animation/modelling or rigging.

In my plans, I want to focus on rigging and animation, as I mentioned in my two blogs. Using Advanced Skeleton in Maya to rig and animate might reduce confused and useless communication with others if done alone. At the same time, I also want to develop my 2D animation skills—primarily to attract attention from my fans on social media rather than for job applications.

My current focus is on developing a career in the film and television industry—including film production or game character animation. I have searched for and taken screenshots of some case studies. During the interview, I might be asked questions such as technical questions and my insights on animation. This can be nervous. But I must face it. I have seen people online share the idea that you should treat the interviewer like an online friend, and the in-person interview like a casual chat. Honestly, this does help me relax a bit.

I could start by applying for jobs or internships at small animation studios—after all, I need to gain experience, because the competition at large studios or companies are too fierce. I might need to work harder. Then I have also chatted to my friends and seniors. Most opportunities to gain technical experience come from internships or jobs. Although it is already May, I still want to try to find an internship. Also, as a job that produces for others, I might meet some difficulties, criticism, or even slander from clients. Self-regulation is also a particularly important skill—when your boss needs you to do something, never add anything extra or fancy. Just like during the animation production process, I can sneak in some slack off where the camera is not filming. This is a lesson learned from the entire service industry. Meanwhile, to make my resume and assets look more competitive, I created my own personal website and an ArtStation account to store all my work. I can upload anything I want without restrictions, including my blog.

Furthermore, I believe that in this industry, personal ability is more important than the reputation of one's school. And I also need to practice, constantly practice. It would be

ideal if I could invite anyone—including animation students or someone who never touched 3D industry to evaluate my animation and provide useful and substantive feedback.

In today's work environment, with the rise of AI, especially in the arts, which has been most affected, being laid off is common. I think I need to adjust my mindset to face setbacks. That's also very important.
